Super View™ Disposable Lens Set
P/N 40412.000
Instructions for use

Indications for Use: Allows visualization of the ocular fundus, vitreous and retinal structures during vitreoretinal surgery.

Parts include:
- (1x) Disposable wide-field lens.
- (1x) Disposable reduction lens for use only with a Zeiss CS Retroscope Microscope.
- (2x) Disposable drive belts for Biom 3e/3c.
- (1x) Disposable “Tornambe” contact lens.

Warning: Never use a product that appears to be damaged!

Directions:

Wide Angle Lenses
Non-Sterile personnel
1. Check the packaging for damage. The product must not be used if any damage is found on the packaging.
2. After a visual check, open the outer plastic wrapping without touching the inner fleece packing of the lenses.
3. Let the lenses, which are packed in sterile fleece, slide on to a sterile surface. Make sure that the sterile lenses are not contaminated during this process.

Sterile Operating Nurse/Surgtech
4. Remove the lenses from the fleece packing without touching the lens surfaces.
5. Hold the reduction lens (A) by its black plastic ring and place it in the Biom’s lens holder (B) so that the mounting ring tabs on the lens fit into the notches in the lens holder.
6. Turn the reduction lens clockwise, passing through the resistance of the spring clip. The reduction lens is now secure and will not fall out.
7. Using your thumb and index finger, hold the wide-field lens (D) on either side of the black arm without touching the lens surface. (Figure 1). Failure to hold the clip in this regard may result in the premature breaking of the clip. The lens is correctly orientated if its position matches the diagram below. (Figure 2) Fasten the lens by inserting the black plastic tab into the slot (C) of the Biom lens holder passing the resistance until the small outer tabs click and lock into position.
8. To remove the lenses after use, grasp the wide-field lens clip in the “front” (Figure 3) and simply break the lens clip in a firm downward motion. Next, remove the “back” portion of the clip and discard. Turn the reduction lens counter clockwise and carefully lift out of the lens ring holder.

Tornambe Contact Lens
1. Swing wide angle module up and out of the microscope beam path.
2. Flush the cornea thoroughly with ophthalmic solution to remove the Cornea Coat or comparable product.
3. While taking care not to touch the lens surface, hold the lens only by its edges and place a “tear drop” amount of Cornea Coat or comparable product on the curved underside of the contact lens.
4. Place on the cornea and hold in place with a cotton swab for several seconds.

Sterilization: These items are delivered in a sterile condition and are intended for SINGLE USE ONLY. After surgery they should be properly disposed of according to medical waste guidelines of your facility.

Contents sterile if package has not been opened, damaged or wet.
